GREEN FLAGS

AREAS NEEDING ATTENTION

Breakfast Habit

Never eating breakfast slows metabolism, increases acidity, and leaves daily nutrient intake chronically inadequate.

Protein Intake Frequency

Rarely consuming protein is a serious nutritional deficiency causing muscle loss, weak bones, hair fall, and poor immunity.

Milk & Dairy Intake

This is a major risk for calcium and Vitamin B12 deficiency — affecting bones, nerves, and blood health.

Fruit Intake

Never eating fruit is a direct risk for Vitamin C deficiency, poor immunity, and increased oxidative stress.

Physical Activity

Complete inactivity accelerates muscle wasting, increases insulin resistance, and places overall health at serious long-term risk.

Diet Pattern Followed

Occasional fasting slows metabolism and causes your body to miss essential nutrients on those days.

Main Energy Source

A carb-heavy diet causes blood sugar spikes and crashes, low sustained energy, and inadequate protein intake.

Vegetable Intake

Eating vegetables only 3–4 days a week negatively impacts gut health, immunity, and skin health.

Sleep Duration & Quality

Poor sleep throws hunger hormones out of balance, increasing cravings and leading to poor food choices.

Fried / Fast Food / Outside Food

This level of intake raises LDL cholesterol, blood pressure, and body weight significantly over time.

Sugary Drinks & Sweets

Excessive sugar intake. Blood sugar control and weight management are both being actively compromised.

Overall Meal Quality Yesterday

Yesterday's meals were mostly one type of food. If this is a regular pattern, deficiencies will develop.

Sleep

Inadequate sleep can increase hunger hormones and affect your nutrition goals. Consider improving sleep hygiene habits.

WHAT YOU ARE DOING WELL

BMI — Healthy body weight

Current Food Intake — Normal diet

Religious / Cultural Food Restrictions — No major dietary limitation

Mobility — Independent mobility

No Tobacco / Alcohol Use — Healthy lifestyle

RECOMMENDATION

Your assessment indicates poor nutritional status requiring immediate attention. We strongly recommend consulting a healthcare professional alongside a structured therapeutic diet plan.

To discuss these results and get a therapeutic meal plan built around your body and any medical conditions, contact our dieticians at eatrobust@gmail.com or +91 95375 21511.

This report is generated from self-reported answers and is intended for nutritional guidance only. It is not a medical diagnosis and does not replace consultation with a qualified healthcare professional.
